

PRELIMINARY

AHV75S75/70
75W ADJUSTABLE HIGH VOLTAGE
DC/DC CONVERTER
2 to 75Vdc Single Output, 65-75Vdc Input

Key Features

- Efficiency up to 81%
- Six-sided shielding
- Soft start
- Short circuit and thermal protection
- Adjustable output

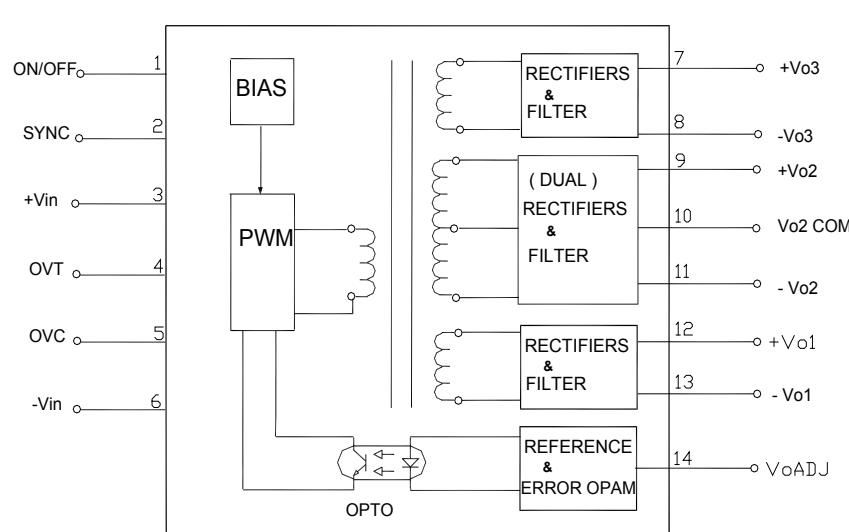

Beta Dyne is protected under various patents, including but not limited to U.S. Patent numbers: 5,777,519; 6,188,276; 6,262,901; 6,452,818; 6,473,3171.

Applications

- High Voltage Programmable
- Voltage Source
- Instrumentation
- Test & Measurement
- Telecom

Functional Description

The adjustable high voltage AHV75S75/70 series DC/DC converters is a 75W multiple output adjustable converter with output voltage range from 2V to 75V, with an input voltage of 65-75V. The output is adjusted either from a 0V to 2.5V or voltage source or a 0-1mA current source. Standard features include; input to output isolation, soft start, external synchronization, input under/over voltage protection and output over voltage protection. Packaged in a 3x2.5x.75 copper case for EMI/RFI shielding and good thermal performance from -25 to +71°C.

Typical Block Diagram

Unless otherwise specified, all parameters are given under typical +25°C with nominal input voltage and under full output load conditions.

¹ ! WARNING - Usage of input fuse with adequate ratings is essential to avoid possible hazard and damage of the unit. A suppressor diode with adequate ratings is intended to be connected in series to the supply for reverse polarity protection.

² The maximum input current at any given input range measured at minimum input voltage is given as $1.6 * I_{NOMINAL}$. Nominal input current is the typical value measured at the input of the converter under full-load room temperature and nominal input voltage.

³ Adequate insulation is to be provided to the converters at the end usage as per applicable requirements.

⁴ Temperature rise on the case of the converters is to be considered during the end usage as per applicable requirements.

⁵ Measured with 100µF external capacitor at the input pins.

EXTERNAL SYNCHRONIZATION

The converter can be synchronized to an external clock. The external clock MUST have a higher frequency than that of the converter's switching frequency. The amplitude of the external clock pulse must be 3.7 volts or greater and its duration between 15nS to 150nS for sync pulse detection.

The circuit in Figure 4 can be used to produce a 50nS to 150nS pulse from a square wave. The circuit will be turned on by the negative edge of the square wave and will stay on for approximately 50nS (depending on the $R2 \cdot C1$ time constant) (See Figure 5).
