¹ The maximum input current at any given input range measured at minimum input voltage is given as 1.6*^{NOMINAL}. Nominal input current is the typical value measured at the input of the converter under full-load room temperature and nominal input voltage (24, 48 and 120Vdc).

² Input power may need to be recycled if the input overcurrent threshold is exceeded after a hard output short circuit.

³ With a 10µH input inductor and 10µF input capacitor.
