## Q25001 24W DC/DC Converter

9-36Vin, +/-12Vout@+/-1000mA

Beta Dyne is protected under various patents, including but not limited to U.S. Patent numbers: 5,777,519; 6,188,276; 6,262,901; 6,452,818; 6,473,3171.

## Functional Description

The Q25001 is a $4: 1$ input range DC/DC converter that accepts $9-36 \mathrm{~V}$ in and provide $+/-12 \mathrm{Vout}$ at $+/-1000 \mathrm{~mA}$. The converter is designed to synchronize to an external clock of 400 kHz .

' When converter enters thermal protection on mode, its duty cycle is reduced momentarily and will resume after its internal temperature (pwm) drops down a few degrees ( ${ }^{\circ} \mathrm{C}$ ). The converter's output behaves similar to hiccup short circuit mode.
Contact factory for $-55^{\circ}$ to $+85^{\circ} \mathrm{C}$ operating temperature range.
${ }^{3}$ The maximum input current at any given input range measured at minimum input voltage is given as $\left.1.6^{*}\right|_{\text {NOMINALL }}$. Nominal input current is the typical value measured at the input of the converter under full-load room temperature and nominal input voltage ( $24 \mathrm{~V}_{\text {IN }}$ ). ${ }^{4}$ Adequate insulation is to be provided to the converters at the end usage as per applicable requirements.
Temperature rise on the case of the converters is to be considered during the end usage as per applicable requirements.

Table 1. When using units as a dual model, the capacitive loading is across each individual outputs.
When used as a single output, the capacitive load is across + Vout to the -Vout. lator to external clock. An open drain output is the recommended 8. Care should be taken to ensure the ground potential differences interface between the external clock to the Q25 SYNC pin as shown between the converters are minimized. In this configuration all the in figure 7. The clock pulse width must be greater than 15 ns . The converters will be synchronized to the highest frequency device. The external clock frequency must be greater than the frequency of the SYNC pin is a CMOS buffer with pull-up current limited to 200 micro Q25. amps. If the external device forces the SYNC pin low before the internal oscillator ramp completes its charging cycle, the ramp will reset and another cycle begins. If the SYNC pins of multiple Q25 converters are connected together, the first SYNC pin that pulls low will reset the oscillator ramp of all the other converters. All converters will operate in phase when synchronized using the SYNC feature Up to five devices can be synchronized using this method.
