

Q25015 21W DC/DC CONVERTER 36-72Vin, 14Vout@1.50A

Key Features

- Efficiency up to 89%
- Low output noise
- Six-sided shielding
- Output synchronous rectification
- Input-to-output isolation
- Soft start
- External synchronization
- Short circuit protection
- Thermal protection
- Industry standard pinout
- External clock synchronization of 393KHz

Beta Dyne is protected under various patents, including but not limited to U.S. Patent numbers: 5,777,519; 6,188,276; 6,262,901; 6,452,818; 6,473,3171.

Functional Description

The Q25015 is a single DC/DC converter that accepts 36-72 Vin and provides 14Vout at 1.50 A. The converter is designed to synchronize to an external clock to a frequency of 393KHz. Output synchronous rectification followed by a very low dropout linear regulator makes it possible to achieve up to 89% efficiency with less than 20mV output noise with external capacitors. Standard features include input undervoltage protection, external synchronization and thermal protection. The converter is packaged in a 2" x 1" x .45" metal case with six-sided shielding.

EXTERNAL SYNCHRONIZATION

The SYNC pin can be used to synchronize the internal oscillator to external clock. An open drain output is the recommended interface between the external clock to the Q25015 SYNC pin as shown in figure 1. The clock pulse width must be greater than 15ns. The external clock frequency must be greater than the frequency of the Q25015.

Multiple Q25015 converters can be synchronized together simply by connecting the converters SYNC pins together as shown in figure 2. Care should be taken to ensure the ground potential differences between the converters are minimized. In this configuration all the converters will be synchronized to the highest frequency device. The SYNC pin is a CMOS buffer with pull-up current limited to 200micro amps. If the external device forces the SYNC pin low before the internal oscillator ramp completes its charging cycle, the ramp will reset and another cycle begins. If the SYNC pins of multiple Q25015 converters are connected together, the first SYNC pin that pulls low will reset the oscillator ramp of all the other converters. All converters will operate in phase when synchronized using the SYNC feature. Up to five devices can be synchronized using this method.
