## NOTE

1. Ripple \& Noise are measured at 20 MHz of bandwidth with ceramic 0.1 uF \& chemi-con KY 47 uF parallel capacitor.

To Oscilloscope

A 30 cm twisted pair of no. 18 AWG copper wire is connected to a 47 uF and 0.1 uF capacitor of proper polarity and voltage rating. The oscilloscope probe ground led should connect right to the ground ring of the probe and be as short as possible.
The oscilloscope bandwidth should be at 20 MHz and connected to AC ground.
2. Hold-up Time measured at $90 \%$ Vout.
3. Main Vout $>3 \%$ Load, 12 V (Aux) / 0.3A., 12V (Aux) need 0.1A Minimum Load, Auxiliary voltage output ground 10.2~13.3V
4. Strongly recommend to conduct this test with DC Voltage. If customer wishes to test with AC Voltage,
please disconnect all Y-Capacitors within power supply.

FUNCTION DESCRIPITON of CN1

| Pin No. | Function | Description |
| :---: | :---: | :--- |
| C1 | -5 VSB | This pin connects to the negative terminal(-V). Return for DC-OK and -RC signal output. |
| C2 | +5 VSB | Stand by voltage output ground 4.2~5.5V, referenced to pin C1(-5VSB). The maximum load current is 1A with Fan, 0.4A <br> without Fan.. |
| C3 | GND | This pin connects to the negative terminal(-V). Return for DC-OK and -RC signal output. |
| C4 | DC OK | DC-OK Signal is a DC output, referenced to pin C3(DC-OK GND). |
| C5 | - RC | This pin connects to the negative terminal(-V). Return for DC-OK and -RC signal output. |
| C6 | +RC | Turns the output on and off by electrical or dry contact between pin C5 (-RC), Short: Power OFF, Open: Power ON. |
| C7 | - S | Negative sensing. The $-S$ signal should be connected to the negative terminal of the load. The $-S$ and +S leads should be <br> twisted in pair to minimize noise pick-up effect. |
| C8 | + S | Positive sensing. The +S signal should be connected to the positive terminal of the load. The $+S$ and $-S$ leads should be <br> twisted in pair to minimize noise pick-up effect. |
